Forward Looking Statements

This presentation has been prepared by Q32 Bio Inc. ("we", "us," "our," "Q32" or the "Company") and is made for informational purposes only. The information set forth herein does not purport to be complete or contain all of the information you may desire. Statements contained herein are made as of the date of this presentation unless stated otherwise, and this presentation shall not under any circumstances create an implication that the information contained herein is correct as of any time after such date or that information will be updated or revised to reflect information that subsequently becomes available or changes occurring after the date hereof. This presentation contains forward-looking statements within the meaning of the U.S. Private Securities Litigation Reform Act of1995. Forward-looking statements can be identified by words such as "may," "will," "should," "would," "expect," "anticipate," "plan," "likely," "believe," "estimate," "project," "intend," "potential," and similar expressions regarding future periods. These forward-looking statements include, but are not limited to, our beliefs, observations, expectations and assumptions regarding the topline data from the SIGNAL-AA Phase 2a and the safety, tolerability, clinical activity including biomarker data, potential efficacy and potential benefits of bempikibart, plans and expectations for Part B of the SIGNAL-AA Phase 2a clinical trial, the expectations surrounding the potential, safety, efficacy, and regulatory and clinical progress of Q32's product candidates, including bempikibart, and anticipated milestones, data readouts and timing, among others. Statements that are not historical facts are forward-looking statements. Forward-looking statements are based on current beliefs and assumptions that are subject to risks and uncertainties and are not guarantees of future performance. Actual results could differ materially from those contained in any forward-looking statement as a result of various factors, including, without limitation: the Company's need for additional funding, which may not be available; failure to identify additional product candidates and develop or commercialize marketable products; the early stage of the Company's development efforts; potential unforeseen events during clinical trials could cause delays or other adverse consequences; risks relating to the regulatory approval process; interim, topline and preliminary data may change as more patient data become available, and are subject to audit and verification procedures that could result in material changes in the final data; Q32's product candidates may cause serious adverse side effects; inability to maintain our collaborations, or the failure of these collaborations; our reliance on third parties, including for the manufacture of materials for our research programs, preclinical and clinical studies; failure to obtain U.S. or international marketing approval; ongoing regulatory obligations; effects of significant competition; unfavorable pricing regulations, third-party reimbursement practices or healthcare reform initiatives; product liability lawsuits; securities class action litigation; the impact of the COVID-19 pandemic and general economic conditions on our business and operations, including our preclinical studies and clinical trials; the possibility of system failures or security breaches; risks relating to intellectual property and our ability to protect our patents and other proprietary rights; significant costs incurred as a result of operating as a public company; as well as those risk and uncertainties set forth more fully under the caption "Risk Factors" in our Quarterly Report on Form 10-Q for the quarter ended September 30, 2024 as well as other risks detailed in our subsequent filings with the United States Securities and Exchange Commission. Any forward-looking statement made by us is based only on information currently available to us and speaks only as of the date on which it is made. We undertake no obligation to publicly update any forward-looking statement, whether written or oral, that may be made from time to time, whether as a result of new information, future developments or otherwise. Certain information contained in this presentation relates to or is based on studies, publications, analyses, surveys and other data obtained from third-party sources and the Company's own internal estimates and research. While the Company believes these third-party sources to be reliable as of the date of this presentation, it has not independently verified, and makes no representation as to the adequacy, fairness, accuracy or completeness of, any information obtained from third-party sources. In addition, all of the market data included in this presentation involves a number of assumptions and limitations, and there can be no guarantee as to the accuracy or reliability of such assumptions. Finally, while we believe our own internal research is reliable, such research may not have been verified by any independent source.

Alopecia Areata Has Life-Altering Impact and Current Treatment Options Are Limited

700K[1] people living with AA in the U.S.

- Often manifesting **before age 50**
- Up to **40% become chronic**, including complete loss of scalp and/or body hair
- Severity of disease and long duration of episode each associated with **lower rates of treatment response**

Olumiant approved in 2022, Litfulo approved in 2023, Leqselvi approved in 2024: all carry **class-wide Black Box Warning**[2]

Durable, long-term remission would be transformative

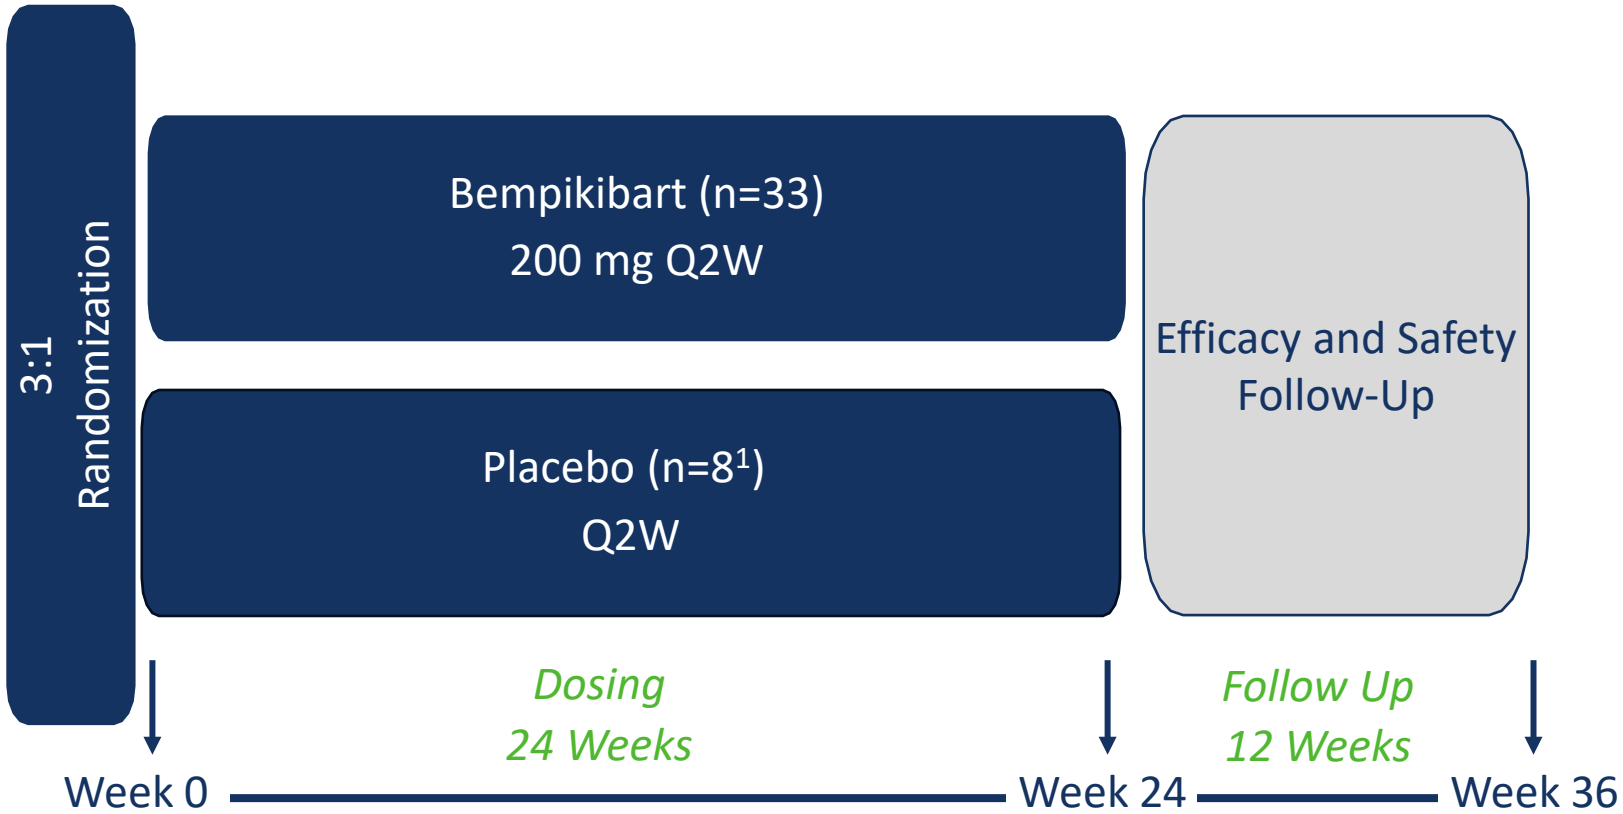
SIGNAL-AA Phase 2a "Part A": POC Study in Patients with Alopecia Areata Study Design

Part A



Design Elements

- First study in AA patients
- Key Inclusion/Exclusion Criteria
  - Severe/Very Severe Alopecia Areata (SALT 50-100)
  - No other forms of Alopecia
  - Duration of current episode >6 months and <10 years
  - Prior use of JAKi allowed with appropriate wash-out
- Primary endpoint: % change from baseline in SALT score at Week 24

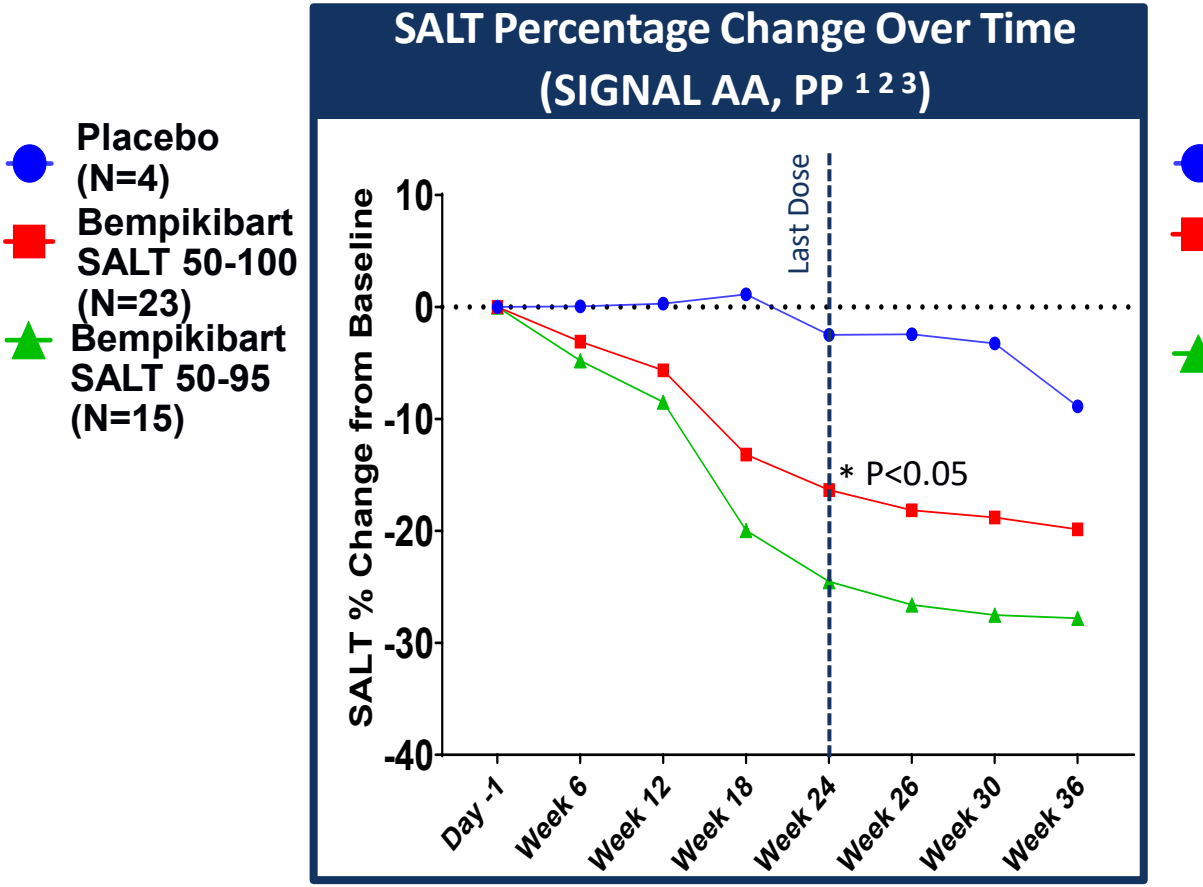
1. Analysis excludes 3 placebo subjects from a single site who were in major violations of inclusion criteria.

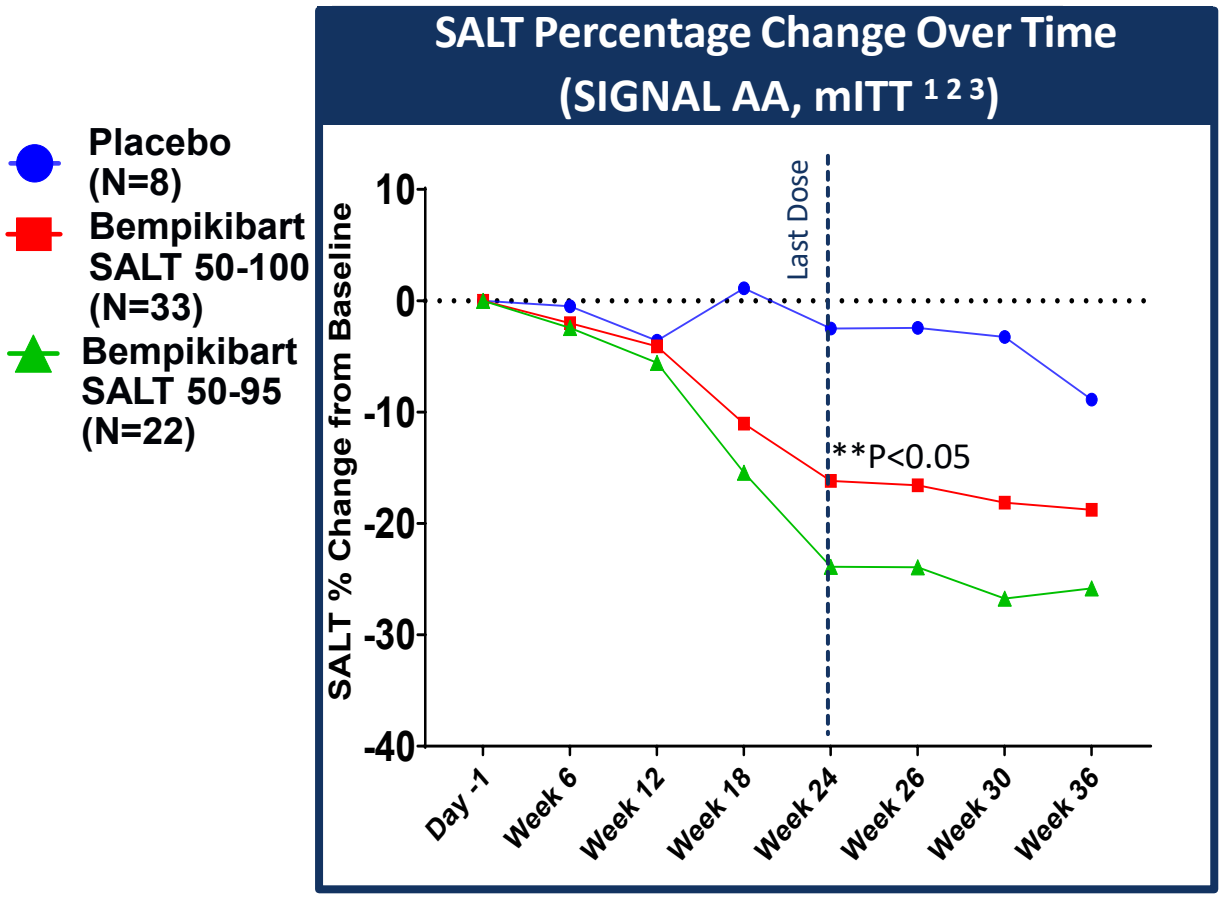
SIGNAL-AA Part A: Demographics

Characteristics	Per Protocol Population (PP)			Modified Intent To Treat Population (mITT)		
	Bempikibart 200 mg (N=23)	Placebo (N=4)	Total (N=27)	Bempikibart 200 mg (N=33)	Placebo (N=8[1])	Total (N=41)
Age (years), Mean (SD)	47.7 (11.3)	59.8 (11.9)	49.5 (12.0)	48.8 (10.2)	46.9 (11.1)	48.5 (11.4)
Sex, n (%) Female	19 (82.6)	2 (50)	21 (75.6)	27 (81.8)	4 (50)	31 (75.6)
Race, n (%) Asian Black or African American White Others	1 (4.3) 7 (30.4) 13 (56.5) 2 (8.6)	0 (0.0) 1 (25.0) 3 (75.0) 0 (0.0)	1 (3.7) 8 (29.6) 16 (59.2) 2 (7.4)	1 (3.0) 10 (30.3) 19 (57.6) 3 (9.0)	1 (12.5) 3 (37.5) 4 (50) 0 (0.0)	2 (4.8) 13 (31.7) 23 (56.0) 3 (7.2)
Baseline SALT Score Mean (SD)	75.8 (20.4)	88.4 (22.5)	77.7 (20.7)	74.9 (20.3)	81.9 (21.0)	76.3 (20.4)
Baseline SALT score, n (%) ≥50 to <95 ≥95 to 100	15 (65.3) 8 (34.7)	1 (25) 3 (75)	16 (59.3) 11 (40.7)	22 (66.7) 11 (33.3)	4 (50) 4 (50)	26 (63.4) 15 (36.6)
Duration (months) current episode Mean (SD)	62 (36.7)	39.3 (20.5)	58.7 (35.4)	65.8 (34.8)	61.9 (30.5)	65.0 (33.7)

1. Analysis excludes 3 placebo subjects from a single site who were in major violations of inclusion criteria.

SIGNAL-AA: Part A SALT Data Through Week 36 Showed Continued Benefit Over Time Supporting Potential for Durable Effect Following Dosing Cessation





Mean SALT reduction continues after dosing cessation, consistent with predicted MOA

[1]Analysis excludes 3 placebo subjects from a single site who were in major violations of inclusion criteria. Step down between mITT to Per Protocol: 10 early terminations, 2 missed week 24 visit, 1 missed multiple doses, 1 major hairstyle change. [2] 2 discontinued or LTFU by wk26, 3 discontinued or LTFU by wk36. [3] Data as of database lock date 02/05/2025

*p < 0.05 vs placebo on primary end point of percentage change from baseline at 24 weeks by Wilcoxon Rank Sum test, 1-sided

**P < 0.05 vs placebo at 24 weeks by Mann-Whitney Rank Sum Test, 1-sided, with missing values included as collected

Bempikibart Demonstrated Impressive Improvement on SALT Reduction at Week 24 Shows Continued Effects After Dosing Cessation through Week 36

Patients with baseline SALT 50-100, PP[1]	Week 24 Plasma PK > Threshold N=23	Dosing Cessation	Week 26[2] Plasma PK > Threshold N=21	Week 36[3] Plasma PK < Threshold N=19[4]
Mean SALT Score % Δ	16.3%		18.2%	19.9%
$SALT_{30}$ (% pts)[5]	17.4%		19.0%	36.8%
SALT Score ≤20 (% pts)[5]	9.0%		14.3%	5.3%

Patients with baseline SALT 50-95, PP[1]	Week 24 N=15	Dosing Cessation	Week 26 N=14[6]	Week 36 N=13[7]
Mean SALT Score % Δ	24.5%		26.6%	27.8%
$SALT_{30}$ (% pts)[5]	26.7%		28.6%	53.8%
SALT Score ≤20 (% pts)[5]	13.3%		21.4%	7.7%

Patients assigned to Placebo (baseline SALT 50-100), PP[1]	Week 24 N=4	Dosing Cessation	Week 26 N=4	Week 36 N=3[8]
Mean SALT Score % Δ	2.5%		2.4%	8.9%
$SALT_{30}$ (% pts)[5]	0.0%		0.0%	0.0%
SALT Score ≤20 (% pts)[5]	0.0%		0.0%	0.0%

PK: pharmacokinetics; pts: patients; SALT: Severity of Alopecia Tool.

[1] Analysis excludes 3 placebo subjects from a single site who were in major violations of inclusion criteria.

[2] Mean trough concentration of bempikibart above 5 µg/ml; [3] Mean trough concentration of bempikibart below 5 µg/ml

[4] 2 discontinued or Lost to follow-up (LTFU) by Week 26, 2 discontinued or LTFU by Week 36

[5] Placebo-adjusted [6] 1 withdraw from the study by week 26 [7] 2 discontinued or LTFU by Week 36 ; [8]1 LTFU by week 30

Q32 BIO

SIGNAL-AA Case Study - Severe AA with 4.5 Year Episode: Response through Week 42 Supports Potential for Durable Hair Regrowth with Bempikibart Treatment

- 52-year-old female
- Duration of episode: 4.5 years
- Baseline SALT: 56 (Severe)
- SALT (Week 24): 10.5
- **SALT (Week 36): 4**
- **SALT (Week 42): 2**

Durable Response and Additional Growth at Week 42

SIGNAL-AA Examples of Continued Response 7 Months Post Dosing Cessation: Supports Potential for Remittive Effect with Bempikibart Treatment

Case 1

- 61-year-old female
- Duration of Episode: 3.1 years
- Baseline SALT: 98.2 (Very Severe)
- **SALT (Week 36): 88.4**
- **SALT (Week 54): 8**

Case 2

- 32-year-old female
- Duration of episode: 9 months
- Baseline SALT: 61.1 (Severe)
- **SALT (Wk 36): 35.3**
- **SALT (Wk 55): 23.6**

Patients with significant hair regrowth after dosing with maintenance of effect ~7 months after last dose support potential for paradigm changing approach

Q32 BIO

Potential for Bempikibart to Induce Durable Responses Supported by Longer-Term Follow-Up

- **A patient contacted sponsor with post-study hair growth requesting expanded access**
- **Sponsor contacted all site investigators regarding patient follow-up**
- **Of patients who responded that completed the treatment period and showed a SALT response during the trial (n=12), all achieved maintenance of response or further hair growth in the post treatment period**
  - For these 12 subjects, median follow-up to date 41 weeks; 17 weeks post last treatment
  - 7/12 achieved additional hair growth by SALT assessment post treatment
- **Data collection ongoing and Open Label Extension expected to begin 1H'25**

SIGNAL AA: Overall Summary of Treatment Emergent Adverse Events Through Week 36

	Bempikibart[1] (N = 33) n (%) [# Events]	Placebo (N = 8) n (%) [# Events]
Participants with at least 1 TEAE	23 (70%) [108]	3 (38%) [9]
Participants with at least 1 TEAE by greatest reported relationship with study treatment		
Not related	6 (18%) [12]	0 [0]
Related	17 (52%) [51]	3 (38%) [4]
Participants with at least 1 TEAE by worst reported severity CTCAE grade[2]		
Grade 1 - Mild	10 (30%) [24]	2 (25%) [6]
Grade 2 - Moderate	11 (33%) [25]	1 (13%) [1]
Grade 3 – Severe (1 patient acute myocardial infarction – not related)	1 (3.0%) [3]	0 [0]
Grade 4 - Life threatening (1 patient nut allergy - not related)	1 (3.0%) [1]	0 [0]
Grade 5 - Death	0 [0]	0 [0]

Bempikibart Demonstrated Favorable Safety and Tolerability Profiles with No Grade 3 or Higher Related Adverse Events

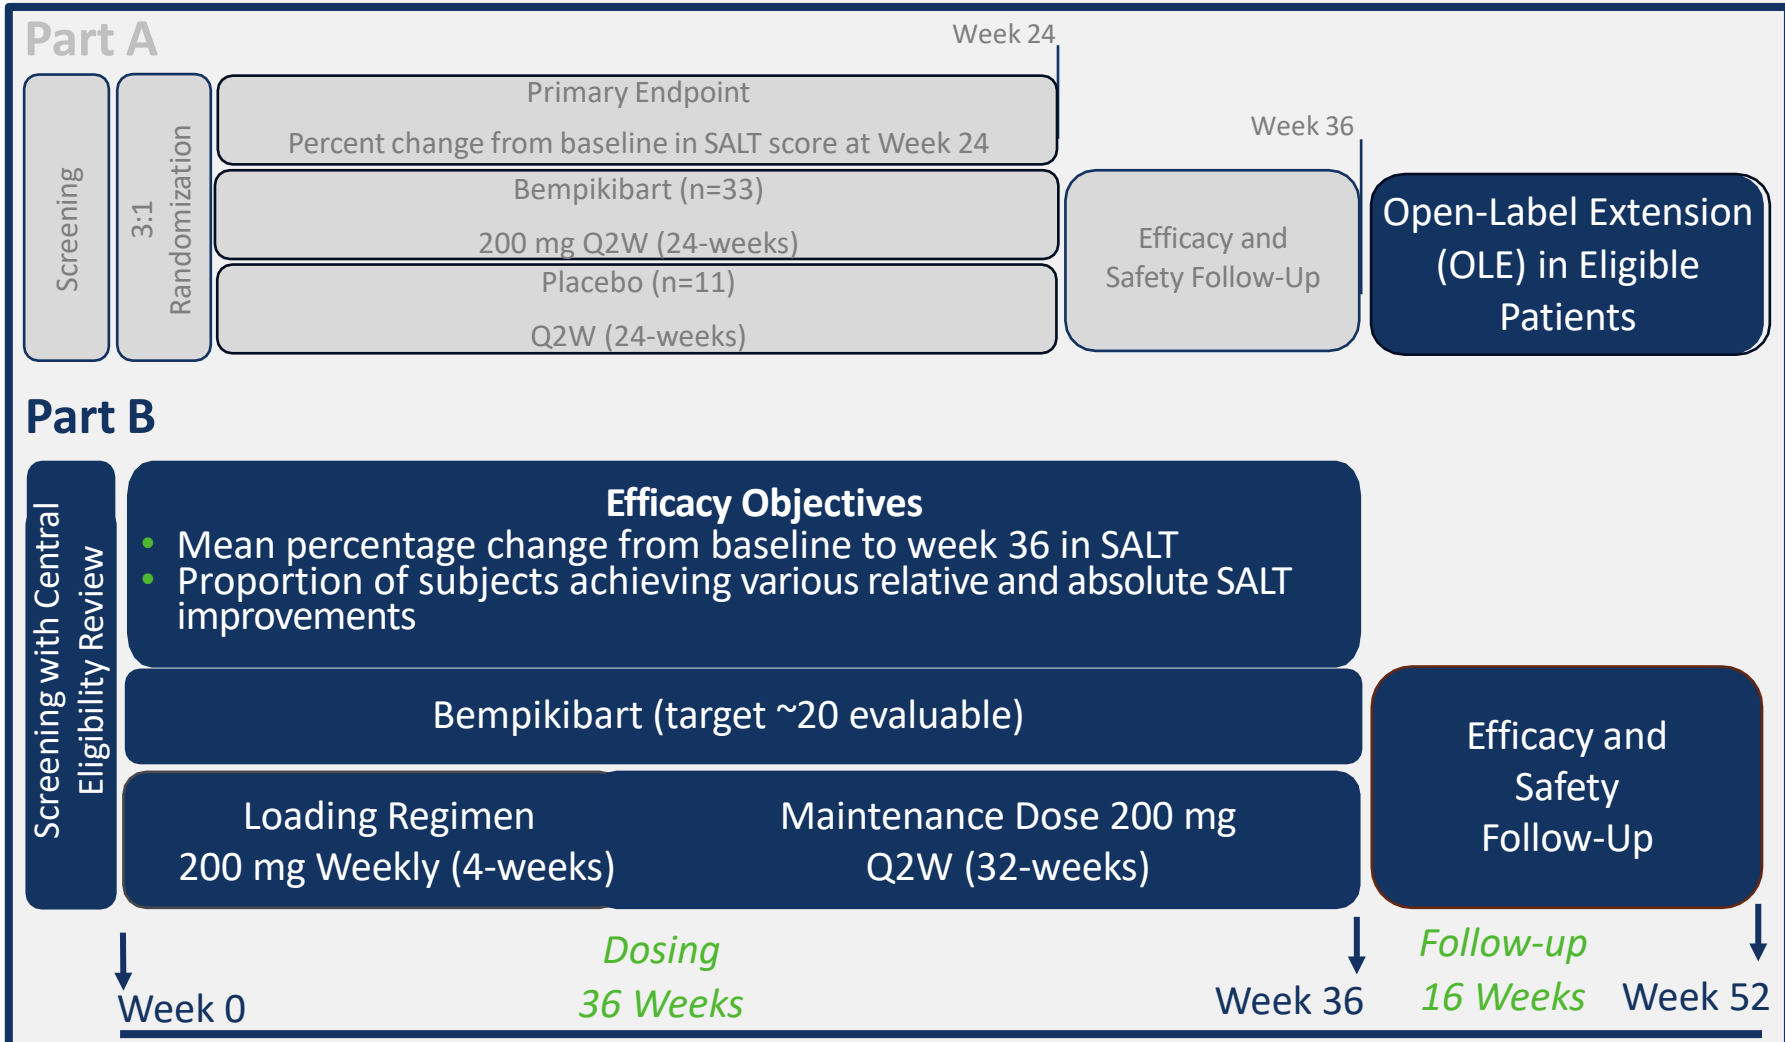
Abbreviations: AA: alopecia areata; AE: adverse event; CTCAE: Common Terminology Criteria for Adverse Events; TEAE: treatment-emergent adverse event.

[1] Participants experiencing multiple AEs were counted only once under the greatest reported relationship with study treatment.

[2] Participants experiencing multiple AEs were counted only once under the worst reported severity for each treatment group.

- 1 Grade 1 Mild Lymphopenia is reported in Bempikibart
- No related viral infections are reported in Bempikibart

SIGNAL-AA Phase 2a: Part A and Part B Study Designs



Design Elements

Part B

- **Key Inclusion/Exclusion Criteria**
  - Severe/Very Severe (SALT 50-100)
  - Duration of current episode >6 months and <4 yrs
  - Exclusion of JAK inhibitors same as Part A
- **Design Modifications from Part A**
  - Loading regimen: designed to accelerate PK/PD dynamics to maximize clinical activity
  - Longer dosing: 36-weeks
  - Longer follow-up: 52-weeks

Summary: Maturing SIGNAL-AA Data Supports Potentially Differentiated Profile in Alopecia Areata

- **Hair regrowth with durable response supports potential for transformative paradigm; extensive MOA literature supports potential long-term durability of effect post-dosing cessation**

- **Response to bempikibart observed in severe and very severe populations**
  - Response in patients with long current episode duration
    - Mean current episode duration in SIGNAL-AA: 5-6 years, substantially longer than prior JAK trials (2.5-4 years)[1,2,3]
    - Literature suggests response rates drop by 50% or more in patients with a current episode >4 years[4,5]

- **All treatment-related events were mild or moderate**
  - No new safety signals
  - No safety findings related to expected, on-mechanism lymphocyte reduction
  - No related infections
